

Django Web Framework

What is Django Web Framework?

- Django is a web framework written in Python.
- A web framework is a software that supports the development of dynamic websites, applications, and services.

django

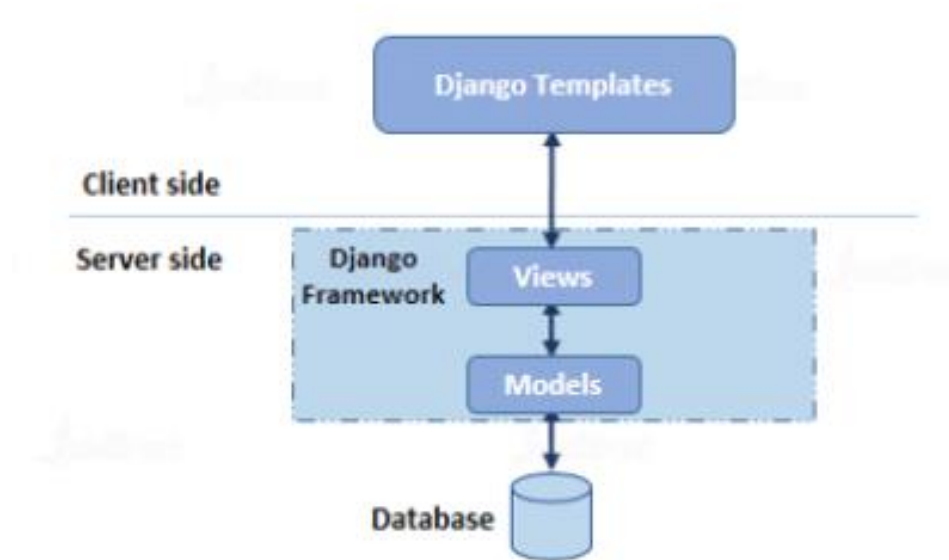

Why Django Web Framework?

- It is a Python web framework

Architecture of Django Web Framework

- Django web framework follows the MVT (Model View Template) architecture. This architectural pattern is designed for easy and rapid web development.

Architecture

- The **model** or the model class is the source of information regarding the data.
- The **view** or the view function takes up different web requests and returns respective responses.
- **Template** layer determines how a user sees the response Django returns.

How these components communicate with each other to make the development in Django easy and rapid.
